As stated above the twisting problem is probably fly related. The main reason for my post is that I don't know what the advantage is to using an Albright knot for your leader to fly line connection. The Albright is a very popular knot for connecting fly line to backing on a saltwater set up. It is a very secure knot but requires the fly line to be doubled over into a bight to tie it which creates a bulkier profile that would tend to hang up a lot more on the eyelets of your rod. A nail knot is a much more streamlined knot for that connection.
