I just came back from taking the water temp with my trusty meter. Lake surface water temp was 70°. The Stilling basin was 65° and the temp at the Gauging Station was 64°. They may be having a problem with the equipment which has happened in the past. Especially since the temp jumped 4° in one day. Also, when the PFBC did electrofishing at Station 5 which is below Reber's Bridge, they would get anywhere from 100 to 200 fish in a 1200 foot stretch. Usually one quarter of the trout were holdovers. There is a significant number of holdover trout in the DHALO section. If you did not harvest the trout I am sure there would be more.
