Certainly could shake things up some. But again, you are using "exposed" in a manner that implies that stuff at depth is radioactive, and stuff at the surface isn't. Being at depth makes it no more or less radioactive than the surface.

ALL ROCK IS RADIOACTIVE. Just some types more than others, based on their composition, not their depth.

If you dig up rock and lay it on the surface, it is just as likely that you are digging up less radioactive material and covering more radioactive material. In a road, or a well, some of the material brought up will be more radioactive than the surface at that spot, and some of it less, as both the surface rock and the stuff brought up will vary wildly.
