Wouldn't the bankers at GE and Westinghouse or the power companies be doing the same thing with nuclear you allege is happening with gas?

No, we wouldn't be discussing the fragmentation of forest in magnitudes of squares miles- with pipelines, subsidized wind farms, and thousands of miles of new roads and pads. This is before we even bring the issue of water pollution into the mix.

If we generated an equivalent amount of this power from nuclear, instead of gas, we would be dealing with generating from football field sized parcels, that have negative coefficient of reactivity reactors that do not melt down.

Obviously, as Pcray mentioned, the biggest benefit to nuclear generation for the nation is that the air would be much cleaner, and that would benefit people clear across the country from any type of power source point.

Greenies are not the primary force opposed to nuclear, it is the gas men. Look at the relative ease at which you can amass a billion dollar fortune from sitting on top of a gas reserve and manipulating a county or states heat and electricity. You pipe force-feed people. They have been derailing disposal sites since the beginning of nuclear power. These are the men that build themselves bunkers to weather the storms they create from their insatiable greed.
