I do alot of pump arounds and based on the funnel I'd say that stream is dropping out about 300 gallons per minute. Thats what it looks like when I am using a three inch pump at full throttle.

I'll add that depending on the substrate there can be a great deal of water traveling through the bedload.

For that water to be leaving at that rate it must be coming out somewhere down grade like a waterfall or else shooting out like a fire hose.

So I bet its above a set of falls.
