Not so. The Tully where the lake now sits was a smallmouth bass, redbreast sunfish, rock bass , white sucker, American eel, and carp creek.

Furthermore, reducing the Lake water level through the summer would have no positive impact on downstream temps. As the lake's fisheries manager I would never recommend it from a lake fishery standpoint unless it was done to develop a vegetated shoreline that could be flooded the following spring to enhance reproductive success and juv habitat for certain lake species.
