Barbless,

Penns has been running pretty low all spring. It got up for brief moments but immediately fell within a few days of the rain event. If I am not mistaken we are still 2 inches below average rain fall for the year. Couple that with a dry fall and uneventful winter and we have a bony river. This week's rain will help but it will fall pretty fast again without more consistent precip. Penns has always got the reputation for muddying and rising quickly which I have found to be totally false. In my experience fishing this river a lot over the last 15 years it takes a ton of precip and snow melt to get Penns up and keep her up.
