Needs brookies btw.

The upper part of that creek was full of brookies 30 years ago (one of the guys I guide with grew-up on this creek). The browns made there way in from the river (which is stocked and has no wild fish) it dumps into and decided they liked it. Stayed and started reproducing. Most of the upper is all private now, so I'm not sure if there are any brookies left. There are none in the open part of the upper.

Pennypacker is just saying fish somewhere else already.

I know you all are NOT referring to me. And if you are...it's out of complete ignorance. In any event, just because we were discussing the stream and it's changes, how does that imply that we don't ever fish anywhere else? That's just goofy... And of course we're not going to name the stream. We'd get 100s of nasty PMs with death threats if we did that. And anyway, as Shane said, we both live in OH, so the creek is obviously on the other side of the state from you two...it's not like you're going to come over and check it out. Especially when you have a hundred creeks just like it right in your own backyards. Stop being cranky and play nice Chaz...
