Cool stuff Bob. I don't claim to be an expert on fish anatomy and what makes fish more or less tolerant of it. But I will say that not all acids are created equally. pH is likely only part of the story. Tannic acid and sulfuric acid, for instance, may not have the same effects at the same pH level. I applaud your efforts at putting some data behind your observations, and find it interesting. But one of the tenants of science is that knowledge leads to more questions. Nature is very complicated.

I wish I could be out there with you all the time, but these kids, I'll tell ya, they take a lot of time!!! On the bright side, last weekend, I did get to fish for the first time since the jam. I caught a 4" bluegill on a worm under a bobber with an 18" rod, lol. My son proved not yet up to the task of winding the reel. He did think the bobber was cool, and kept calling it a ball. didn't care much for the fish itself, which is why I only caught 1, as we put the rod away and started chasing geese instead.
