In article, it states why the hatch is mostly unknown and under fished. The fly tends to hatch in the time of the summer when most of the streams that it hatches in are too warm for trout fishing. Also, the flies tend to hatch in stream sections that most fisherman would consider frog water and probably skip over. In the article, Weamer mentions finding the nymphs burrowed into the real muddy bottom in water that might only be a few inches deep. In order to find the nymphs, he had to shovel the mud onto a screen.
