Do you know if the water temps of the discharge from the plant will be cold or not? And do you know the volume of the discharge?

If they will have a steady supply of cold water from the deep mines, and the treatment plant doesn't warm up the water too much, they could really have a good wild trout fishery.

If not, it will be too warm there for a good wild trout fishery. But, there's nothing wrong with wild smallmouth bass and stocked trout. It beats the heck out of "red and dead," which was the situation for a very long time.
