haha.

FWIW, no, I don't disagree with anything rowbear said.

Not that this is a surprise. Unlike many, I actually read the study, and it's conclusions, and understand how to interpret scientific results. ;). Zing!

The one thing I learned was this:

Quote:

The evidence for interbreeding between hatchery and wild BKT is mixed, in fact it is VERY mixed.

Everything I've seen has been with similar conclusions as this study has been, so not all that mixed. That said, it's not my job to study this, but rather a side interest. Thus, I haven't done an exhaustive literature search like he probably has. Instead, I've only read those studies that searched me out! And when you troll predictable, repeatable circles, you tend to only see studies that support their position, and you only get one side of the story.

It's nice to get someone commenting who has actually studied this, officially, and has done their due diligence.

Thanks rowbear! And lack of conclusive answers is what biology is all about, lol. (As a "hard sciences" guy, I have to zing the bio guys). Too many dependent variables. Leaves you with the choice of not sufficiently isolating them, or narrowing the study so much that it only tells you .00001% of the story. I prefer the latter, which this study fits, but it results in needing a whole lot of studies just like before a clearer picture emerges.
