Unless all the water freezes, it should not read 32 degrees. Maybe 33-36.

Or maybe it should....

Here's [an official procedure](#), in case a trout stream thermo really needs to be that accurate...

Quote:

Calibration in Ice Water

- 1.Add crushed ice and distilled water to a clean container to form a watery slush.
- 2.Place thermometer probe into slush for at least one minute taking care to not let the probe contact the container.
- 3.If the thermometer does not read between 30° and 34° F adjust to 32° F. Non-adjustable thermometers should be removed from use until they have been professionally serviced.
