the problem is you can only jam so many trout into those spring seeps which also leads to added stress, predation (man & natural) and spread of disease because the fish are so close together.

If the river (or a significant portion of the river) was kept cool all summer long, can you imagine the numbers of trout that may be in there to catch?

I hear ya, if that water was cooled with added dam depth we would be looking at a tremendous density of browns and a lot more brookies of great size in my opinion. I have caught some large native brookies > 13" as is.

There is a lot of good food right now, hellgramites, golden stones, chubs, suckers, lotta ant sand mounds dumping them in. I dunno know if cooler water would benefit some other types of shiners or not, but who knows.

And, of course, the access is pretty phenomenal even above the bike trail in White Haven.
