How exactly does the smart-phone app work if it's out of cell phone range? Wireless connections on a smart-phone are:

- 1) cellular
- 2) wi-fi
- 3) Bluetooth
- 4) and device maybe NFC enabled
- 5) GPS (receiver only)

If out of cell range, definitely 1 and probably 2 are not options and 3 and 4 are near field communications only.

Just curious how the app developer is making this work.. Or is there an external device the app interfaces with?
