Being somewhat new to this fly game, I have been we fished Tricos...or seen them. I tied up some this week and headed to breeches early this morning. Not a single Trico to be found. I was fishing between Allenberry and the Run in some of the deep runs that transition to the frog water near Allenberry.

So...do these bugs "skip" days here and there? Or was I just in an area that doesn't get Tricos, or ...any other ideas? I was expecting a pretty good spinner fall from reports I've been hearing.
