Theoretically, the stream should be a good streamer stream as long as the streamers are weighted enough to get them down. The stream has not been electrofished for a number of years, but it has a history of low density forage fish populations and a fairly high frequency of less-than-ideal weight trout (many are a bit thin). The weight problem still exists based on fish I caught a few weeks ago. One would think that these fish should be looking for " a good meal" and with limited forage fish (if that is still the case) they may be more likely to hit a streamer there than in streams where forage is not a problem. It's worth a try.

Agree, agree, agree. As I mentioned in a previous stream report post, this stream has never produced well for me with streamers. Not that fish haven't hit a bugger drifted or stripped, but a large of my success on this stream has been with generic nymph patterns (PT, BHHE, etc.). If you're lucky enough to catch something coming off, all the better, but going underneath you can't beat a caddis pattern.
