HD - That is 100cfs over inflow up to 300cfs. So if 200cfs were coming into the reservoir and the reservoir is at 1370' the Corps will release 300cfs. Despite the fact the cold water is gone, an augmentation of 100cfs which is what the Corps is doing, does in fact help the fishery imo. That said, I don't like the 'fishery release' designation they give these releases. They should be called 'biological release' or something along those lines since some anglers might misconstrue these releases to mean a good fishing release, when any anglers knows the trout fishing in the Lehigh most years during the summer months is less than optimal.
