A brine washing station was exactly what I was thinking of. They're being set up at other places where Didymo is found.

Are they effective? Dunno, but the educational aspect of these stations would likely raise awareness of the problem - at least get people thinking of possible better options for cleaning gear.

Here's an [article](#) that explains more about it from the Yough.

The TU chapter that built these stations stated the stations cost \$50 or \$60 bucks (with some donated materials). The upkeep would be the worst part, I would think.

It's better than doing nothing, IMO.
