Patrick: It is interesting to see what channel modifications the floods create. A year of excess rain like this one is welcomed for that reason. Though I've never fished it, and likely never will, your post has made me curious about the changes to your stream. Keep us posted on your findings. I'd like to know if the removal of the dams has improved or hurt the trout fishing. After all, the wood is still there, but has moved to different locations.

BTW, are you familiar with the Rosgen stream classification system? If so, how would you characterize the stream?
