i like to add rubber leg antenna on mine as well. The do not look as real but i like the the added movement. Depends on the hole size of your bead if you can slide it up to the eye over the legs.

I like using this pattern a lot. I have made some very heavy versions for high water with a tung bead head, single wrapped body, and double wrapped thorax. It is a load to cast but definetly gets you down.

Thanks for the video.

Yea. I find that you get plenty of movement just with the tails and 4 legs. Some people add another set of legs, and antenna on theirs but I'd rather save the time and rubber legs! It's all about preference and what you like.

So, same thing with the lead. What I tied in the video is typically the heaviest I go, because around where I fish if the tungsten bead, lead wire, and a good tuck cast doesn't get you down...yikes. Thank you for the feedback!
