Nearly all of my WW fishing is in the Swatara watershed...mostly the main stem, but a few smaller tributaries too. RB's are by far the most common and represent probably 70% of my Sunfish catch. Greens are next around 20%, and BG and various hybrids make up about 5% each. Pumpkinseeds are rare birds for me...I get one or two pure Pumpkinseeds per Summer. BG and PS are somewhat more common in the smaller tributaries where they are closer to upstream impoundments I've found. RB's are clearly the dominant Sunfish species in that watershed though.

FI - I agree...big is a relative term here. I caught a Green that approached 10" once from underneath a low head dam on the Swatara...one of those fish I really wish I got a picture of but didn't...camera was at home drying out after a dunking the day before. BG can get bigger, but anything in the 5-6" range or bigger is a big fish for the other three species.
