Does anyone have any input on the 281 bridge near the outflow section? It seems 2 weeks ago the area was abundant with trout. I took a trip there the 21st-24th this week and had no luck in catching anything. I've just started fly fishing this summer so I'm no expert, but I'm guessing the trout could have migrated downstream further with all the rain we've been having, i.e. more discharge from the dam? I was trying copper johns, worms, buggers and not one bite. Anyone else have any luck there recently?
