I saw a similar sized native in a deep and large pool in Lycoming County last year. It swiped my size 4 bugger and I missed it. I saw the fin stripes clearly. This was after catching several in the 12 inch range from the same pool. The girth of the one I missed was incredible. I'm convinced that starting mid to late summer these fish will swim up select streams from larger marginal trout streams or rivers. Just curious, was it a mixed brook/brown stream?
