Sediment is a problem in Millstone.

This entire area has pretty much lost the majority of its buffering capacity over the last 20 or so years when it comes to acid rain. Acid rain seems to cause a slow and steady death.

Many of these streams were never great for wild trout but they did have fishable populations. Its funny the stream on the southern side of the river in this area are all a lot more productive.

But as has been mentioned before the Clarion Watershed is terrible for wild trout so please fish else where! ;)
