lol.

I'm not real familiar with Millstone, but do agree with you FD on the Salmon Creek drainage. That one would be worth a look too. There is one decent trib (Little Salmon), but just decent, not great. The Branch also has a few wild fish, but is far from good. But most of the tribs should hold brookies and don't, and the main stem itself won't even hold stockies for very long. And while it is overfished after stockings, harvest isn't the main issue. They leave. And you can verify this by fishing around the mouth, it is a non-stocked section of the Tionesta that becomes a hot spot a few days after they stock Salmon.

Ashame, too, because Salmon is a relatively large stream that has good structure and does stay cold. The Branch, too.

I don't really know that the problem is acid there, but always suspected it.

Troutbert, I too have fished Swift Run, with similar results as Swattie. It has fish, but it's not very good.
