It really depends on the thermometer itself and also the reading of the thermometer when it's put into the water.

Try this: Put the thermometer in the water for 30 seconds and take a reading. Do the same thing for a minute and see if the reading is different. Try longer. You can get an idea how long it takes for your thermometer to give you the correct reading.

Also, I attach a lanyard to the thermometer and let it hang down into the water. The lanyard prevents loss and you can tie on a fly or do other things while the thermometer is submerged.
