It does happen in nature...one of the other excerpts I read and I'll post it if I have time, referred to Acid Rock Discharge. Its is an ongoing process though and the stream would be acidic for a longer, in geological terms, period of time. It would not happen suddenly unless of natural erosion exposed a previously unexposed acidic formation and even that would slowly increase the streams acidity. It would be much more difficult to remedy if someone felt the need to do so. It may also be why some PA rook trout have a natural tolerance for a certain amount of acidity.
