appreciate all the work you and your team do and the contributions to rational fact-based discussions on this board

Not sure if this is already your interpretation, or an extension of it, but i would think a reduction from 8 to 5 is not affecting the total harvest much (in the noise) because not that many anglers keep more than 5... but I suspect there would be a rather significant impact once you start limiting what certain anglers would otherwise creel... I imagine the survey data shows that a limit of 2 or 3 would reduce the harvest measurably.

is that born out by the data?
