Foxgap239 wrote:Other places where brookies inhabit that browns don't like are streams where the water stays really cold most of the year and does not have a lot of aquatic food. This tends to be mostly mountain freestone streams. .

that might be it. for these freestones to be cool enough to support brookies year round, i figured the elevations must be quite high.

though coming from a UK background where even the tiniest burns/rivulets produce small dark skinny browns i'm surprised.

thanks Foxy !
