Agreed all above.

Five things:

Hook: Start with a thin-wire dry fly hook

Dubbing: Use the right dubbing. Proper dubbing technique using synthetic dry fly dubbing should make your fly float well

Hackle: Good stiff, web-free dry fly hackle of the proper length will make it float well

Hair: Not all hair is created equal. [Here](#) is an article about selecting the proper hair for tying hair-winged dry flies

Proportions / Technique: Take a look as the pics and tutorial posted above. Proper construction and proportions of a fly make it act properly in or on the water. In this case float.

Keep practicing and use the proper materials. Each fly you will will be an improvement on the last.....until voila!...a fly that floats and catches fish.
