Absolutely. Some of those brookie streams rely on their own young for food.

The previous example of Spring creek doesnt work in my book. Certainly enough food in there to grow many fish to gigantic proportions. I dont know the reason of the size cropping there. Constant pressure? The residual mercury and whatnot from the days when it was polluted? Lord only knows but the question of the rarity of very large trout in there has always puzzled me.

They're there, but few and far between.
