There is no doubt that you can manipulate size through harvest.

A given body of water can handle a certain biomass. The word is Biomass, not numbers.

My harvesting mid size fish, you do increase the potential sizes. This is especially true with impoundments, but also true in streams to varying degrees. But I also agree with Squaretail that streams with extremely high fertility such as Spring Creek would be much harder to manipulate through this method especially since the anglers wouldn't follow the recommendations anyway.
