So, for those who know more about this kind of thing than I, what would the effect(s) be of putting the 10 wt. on the rod stated above?

They're arbitrary numbers made up by people who think they go together. Sometimes they're right, sometimes they're wrong.

Only one person is really capable of deciding, and that's the guy who uses it. In this case, that would be you.

Rather than ask a bunch of Internet experts, why not walk outside and try it out? You'll learn far more useful information that way.
