You can still use a drying wheel & cover a batch of flies at once. If you're concerned about the cost of a commercial drying wheel (roughly \$30-\$40), you can make your own for a few bucks. Here is a link I used.

[DIY fly drying wheel](#)

If you purchase a Disco Ball motor & make your own mount you'll be good to go. I think I got my motor at Spencer Gifts at a local mall for maybe \$8. My dad had some scrap wood around the house & I used the end of a swimming pool noodle as my foam cylinder (found the noodle in the trash). All in all, cost me maybe \$15 to make and about 1-2 hours time. Well worth it. I made mine so I can take it apart & easily store it also. I don't have any pictures, but could always try to post some if interested.

The UV stuff is definitely the way to go. I started using Clear Cure Goo & love it. Cost is definitely a factor, but the product is so much easier to work with & no drying wheel required! Good luck!
