I've heard some PA TU and PFBC talking about working on fixing culvert issues here in PA.

This is not entirely new. In 1998 an alternative to the old style culvert was built on Sixmile Run in Centre County. It is a concrete double box culvert.

I agree with FD that the structure in the photo is likely to get jammed up with debris, i.e. trees washed down by floods. That's often been a problem with traditional culverts and bridges.

We have some engineers on here. What would be a solution to that? The same structure but just much larger?

BTW, the article says the cost for that structure is \$10,000. Seems low.
