Well, as I've said here before...if you want it to be like the golden olden days of yore that none of us ever experienced, you're gonna have to dam the stream back up again and create a series of brookie ponds to recreate that fishery. And you could do this in the ditch since the breastworks still exist, then we'd be fishing from the paved road and where you stand now to fish the ditch you'd either be treading water or sitting in a float tube. This stream is nothing like what it used to be, and nothing like what it was when it first earned its reputation, those days are long, long gone.

No change in the physical structure of the stream would be required to have a brookie section in the upper end.

Brookies do not require dammed sections. They were there before the dams.

They live in a great variety of physical environments, from ponds to very high gradient streams, and the full range in between. There is no physical limitation whatever to brookies living there.
