My personal view is that the genetic strain of brook trout is not an especially critical issue with respect to management decisions....however, I recognize the point that other folks feel that unique strains deserve special protections.

I agree that the genetics of the brookies is not a particularly important issue. If they are brook trout and they can live and reproduce there, that's good.

But if there is some feeling that the genetics of those brookies aren't "good enough", then they could bring in some brook trout whose genetics are "good enough" from another stream.

Regarding these rainbows. Do you see spawning in the fall or in the spring, or both?
