I can't help but notice every thread you make is either buying something, selling something; or asking opinions on buying something, or selling something.

Have you considered using something that you've bought and actually forming your opinions on what you may or may not need at this particular juncture in time? You will find that when you put down the catalog and actually try something that you've bought that you might not need to endlessly solicit the opinions of those who are not you, and who do not necessarily share your opinion on things.

It will, in the end, greatly cut down on the amount of somethings you're buying, and then turning around and selling.

However, lest there be not nugget of topical information in this post, allow me to state that the "rule of thumb" was people bought equipment in two-weight intervals, thus 3/5/7 or 4/6/8.

However, if you actually used, instead of simply collected and sold, equipment then you would know how much you, personally, might see a difference in a 7'6" 3wt vs a 9' 5wt, and whether you need an 8' 4wt to split the obsessive difference or if you could, actually, simply do it all with one of the three, anyways.

I look forward to your next dozen threads comparing every high dollar 3wt rod on the market.
