PhilC: Thanks for the comment. I read that the attached hackle stem makes the wings sturdy enough to cause the fly to twist the leader a lot when casting (like when one has their fly stuck in a small leaf). The article suggested that not attaching the hackle stem when tying the wing in the upright position corrects this problem... In my attempt I may have over compensated. I'm pretty new to tying and fly fishing in general so this is a very much a "new" technique to me. I will try a few with the hackle attached to see if I experience the twisting problem that was described.
