It might have been that on Friday, things would have picked up a little later in the day if I had stuck to Elk for the afternoon. Thursday night was full of rain/sleet/snow, and places upstream in the watershed had several inches on the ground, which proceeded to melt quickly with the warm ground. It may have been more about water temperature, rather than clarity. As I said, the clarity wasn't perfect on Friday, but I didn't think it was all that bad either.

This is probably what was going on. Had a similar experience about four years ago. Drove up in snow; 3-4 inches on the ground that melted off the next day. I think the jolt of cold water slowed down the bite. We ended up picking up a handful of fish mid-afternoon in some sun drenched holes. I hope I don't mirror your experience tomorrow and Thursday..
