I love it! Just gorgeous.

A couple interesting notes on these guys: the big, upper fish has a very strong white edge on the upper caudal (tail edge). This is not uncommon but oftentimes the white edge is mainly, if only, on the lower edge. This guy has some good white edges. Also, his dorsal has that striking transition from yellow/green on the forward, lower part into deep, red/orange on the upper, outer half.

The smaller fish with the beautiful blue spots also has an interesting operculum (gill cover) with a couple striking brown and green patches. The upper fish has some of that bright green too, but less so.
