I'm sure it's an extremely low alkalinity, infertile freestoner. Seemingly all of the small, steep Pocono streams are that way. Most are pretty tannic too. Not sure on Black/Hayes, but I bet it is at least somewhat tannic. Someone that's fished it can verify.

I agree with salmonoid that on most days, it won't fish very well in Winter, despite what any guide books may say. This is pretty much standard for small freestoners in Winter. If you catch them after a rain, and during a warming trend you can have a decent day, but they won't show their best stuff until the afternoon water temp is consistently in the mid 50's, or higher. Even then, and especially with Browns, you want to fish them after a rain event.

As salmonoid mentioned, Winter is the best time to do your scouting...less brush along the streams and easier to get around. If you're walking along the stream though, you might as well take your rod!
