More evidence of the wild trout boom across central PA.

Mike,

Care to hazard a theory to explain the increased wild BT biomass in this particular waterway? 😊

Also, with Class A biomass now, this section would be a good candidate for removal from stocking in keeping with the PFBC need to identify streams for an abatement of stocking. Or, if not complete removal, then perhaps a 50% reduction in number of stocked fish or just drop this section from the in-season stocking.

Anyway.....some more good news.
