Stagger - Try this.

Mount the spool of thread in the bobbin, and pull out about 6 inches of thread.

Feed the end of the thread into the hole at the base of the tube (the one between the arms of the bobbin).

Put the tip of the bobbin in your mouth and inhale.

I never put lead wire in a bobbin. Just keep the spool in your palm and wrap with that hand, while holding the tag end to the hook shank.

The lead wraps should be moveable on the shank, but not loose enough that they spin easily. A little tension while wrapping does the trick. When done wrapping them, use your finger nails to push the coils together to eliminate any gaps.
