Have never seen jack dent branch, so I may be off base, but I see that there are roads along it. JDB shown in the image below; blue lines are nat repro streams. I understand there was clear cropping from stockie fishing in JDB & Medix along the roads. However, the area and headwaters streams seem to have wild trout. so was the cropping in accessible stretches of JDB a preservation issue for native trout here, or more of a native-trout fishing issue? if brookies are established in the area, but cropped along the road by stockie fishing, I might be inclined to just let that go and try another stream away from the roads... (sounds like situation w/ cold run area in Schuylkill)

it might be ideal to end the stocking, but fish biology in PA involves politics. and anglers who lose fights over stocking probably are more annoyed than educated about wild trout fishing?
