As others said, it comes from experience.

You said you've been looking at the gauge for your local stream. Just look at the gauge every time you go fishing, or even drive by the stream and start comparing the cfs on the gauge to what you see on the stream.

Eventually you will get a rough idea of what levels are:

- 1) too high
- 2) too low
- 3) the range in between, where its good to fish.
