Thank you to all who have replied on this topic. This is good stuff and has answered a lot of what's been swimming around in my head.

Pcray -

Thank you for the visual examples. I had done a little bit of historical snooping - expanding date ranges and such - but was not getting as much out of it has you have illustrated with these sample charts.

Part of my problem in correlating this stuff is that I live so damned far away from the places I usually fish. The 3-4 hour drive into Utah almost always is preceded by a call to a friendly shopkeeper up in Circleville, Utah (Circle Valley Anglers) who stays regularly acquainted with the streams and rivers I usually hit. Admittedly, I usually just call, and if he says it should be good to fish, I go. If not, I stay home. I'm glad we've gotten more in depth on this because, at some point, I need to become more self-sufficient.

This whole topic is about to become very important as I have a firend flying out here from my old Air Force duty station Nebraska in mid-May to hit the Spring bite up there in utah with me. I don't want to waste his time and the price of a plane ticket running around from one blown out/crappy stream flow to another.
