They diverted the sewage a mile upstream instead of letting it flow from the break point down?

Exactly how would YOU fix a broken pipe that still had water flowing in it?? You don't just dig a 5,000,000 gallon hole and put sewage into it. Also, it was flowing at 5,000 gallons/minute. At that rate it would fill up the largest tanker in less than three minutes. So what's your solution?

I agree that it's a huge failure on the part of the twp. Condition and capacity of these aging sewer systems never seems to be an issue when they want to add a new subdivision...
