Blueheron, said it best.

Yes it's unfortunate, but sh!t does happen. Suing is not going to solve the problem, just like it rarely solves any problem. It just makes one entity happy and punishes the masses in the long run.

Timmy, they need to get the flow away from the break, just as you'd shut off the water to fix a leaking pipe in your house.

I'd venture a guess there are not that many valves built into the system because it's, obviously, an older design (lax environmental laws). I'd also guess the design could be over volume (population boom since it was built), and maybe it can't be totally shut off.

Disclaimer: I've never seen the stream in question, or lived in a place with public water, but I've done some residential plumbing.
